

# **Superconductors: visualization and applications**

**N. Nancheva, P.Docheva**

**University of Rousse**

**Bulgaria**

# What is a Superconductor?

- A superconductor is a very pure metal, an alloy or a compound that allows electricity to be transmitted with minimal losses.
- A higher current flow may occur with lower energy losses than common conductors.
- Many elements can be coaxed into a superconductive state with the application of high pressure.

# Superconductive elements

**KNOWN SUPERCONDUCTIVE ELEMENTS**

■ BLUE = AT AMBIENT PRESSURE  
■ GREEN = ONLY UNDER HIGH PRESSURE

# Type 1 Superconductors

- are very pure metals characterized as the “soft” superconductors
- were discovered first and require the coldest temperatures to become superconductive
- they exhibit a very sharp transition to a superconducting state and
- "perfect" diamagnetism - the ability to repel a magnetic field completely
- have too low critical magnetic field  $B_c$  and are not attractive to industry
- have different crystal lattices – FCC, BCC, HEX, TET, ORC, RHL
- BCS theory explains the behaviour of these superconductors by means of Cooper pairs

# Examples of type 1 superconductors

( $T_c$  – critical temperature;  $B_c$  – critical magnetic field)

<i>Material</i>	<i><math>T_c</math> [K]</i>	<i><math>B_c</math> [T]</i>

$B_c = 0.0413$

Lattice RHL

# Type 2 Superconductors

- Elements (V, Tc, Nb), compounds or alloys, copper perovskites, rare ferromagnetic superconductors, superconducting pyrochlore crystals - known as the "hard" superconductors
- differ from Type 1 in that their transition from a normal to a superconducting state is gradual across a region of "mixed state" behaviour
- have two critical magnetic fields –  $B_{c1}$  and  $B_{c2}$ . Below  $B_{c1}$  the superconductor excludes all magnetic field lines. At field strengths between  $B_{c1}$  and  $B_{c2}$  the field begins to intrude into the material. When this occurs the material is said to be in the mixed state, with some of the material in the normal state and part still superconducting. At  $B_{c2}$  the superconductor stops superconducting.
- with high critical temperature, critical current and critical magnetic field
- extremely attractive to industry
- crystal lattice – TET, ORTH
- the behaviour of these superconductors is not explain yet

# Examples of type 2 superconductors

- Heavy Fermions
- Ruthenates
- Tungsten-bronze systems
- Fluoroargentates

# Examples of Atypical Superconductors

## Fullerenes

The fullerene – also called a buckminsterfullerene or “buckyball” exists on a molecular level when 60 carbon atoms join in a closed sphere.

$\text{Na}_2\text{Rb}_{0.5}\text{Cs}_{0.5}\text{C}_{60}$  –  $T_c = 8 \text{ K}$

$\text{Cs}_3\text{C}_{60}$  –  $T_c = 40 \text{ K}$

$\text{K}_3\text{C}_{60}$  –  $T_c = 18 \text{ K}$

C-60 doped with the  
interhalogen compound ICl –  
 $T_c = 60\text{-}70 \text{ K}$

# Examples of Atypical Superconductors

Superconductor that conducts in single-walled carbon nanotubes at 15 K. This was discovered by Chinese researchers in 2001.

# Examples of Atypical Superconductors

## Organic superconductors

Organic superconductors are composed of an electron donor (the planar organic molecule) and an electron acceptor (a non-organic anion).

- $(\text{TMTSF})_2\text{PF}_6$  (in figure)
- $(\text{BETS})_2\text{GaCl}_4$
- $(\text{TMTSF})_2\text{ClO}_4$

# Examples of Atypical Superconductors

## Heavy fermions compounds

- $\text{CeCoIn}_5$  –  $T_c = 2.3 \text{ K}$
- $\text{UPd}_2\text{Al}_3$  –  $T_c = 2 \text{ K}$
- $\text{Pd}_2\text{SnYb}$  –  $T_c = 1.79 \text{ K}$
- $\text{URu}_2\text{Si}_2$  –  $T_c = 1.2 \text{ K}$
- $\text{UNi}_2\text{Al}_3$  –  $T_c = 1 \text{ K}$
- $\text{Al}_3\text{Yb}$  –  $T_c = 0.94 \text{ K}$
- $\text{UBe}_{13}$  –  $T_c = 0.87 \text{ K}$
- $\text{CePt}_3\text{Si}$  –  $T_c = 0.75 \text{ K}$
- $\text{UPt}_3$  –  $T_c = 0.48 \text{ K}$  (in figure)

# Examples of Atypical Superconductors

## Ruthenates

- $\text{Sr}_2\text{RuO}_4$  –  $T_c = 1.5 \text{ K}$
- $\text{SrRuO}$  –  $T_c = 1.5 \text{ K}$
- $\text{SrYRuO}_6$  –  $T_c = 1.5 \text{ K}$
- $\text{RuSr}_2(\text{Gd},\text{Eu},\text{Sm})\text{Cu}_2\text{O}_8$  –  $T_c = 58 \text{ K}$

## Tungsten-bronze system

- $\text{Na}_{0.05}\text{WO}_3$  –  $T_c = 91 \text{ K}$

## Fluoroargentates

- $\text{Be-Ag-F}$   $T_c = 64 \text{ K}$

# Applications of Superconductors - 1

- **Superconducting magnets**
- **Superconducting cables** - First HTS cable installation in a utility network is scheduled for the year 2000.
  - The first HTS coaxial HTS cable demonstration is scheduled for that same year.
  - The first commercial sales of HTS cable wires are expected shortly after 2001
- **Superconducting wires**

# Applications of Superconductors - 2

- **Scanning SQUID microscope**
- **Devices that use the absence of resistance of superconductors**
  - High current superconducting wires.
  - Radio Frequency filters in cell phone receivers
- **Superconducting quantum devices**
  - To define the Volt
  - “Quantum Metrology”
  - As magnetic field detectors

# Applications of Superconductors - 3

## Magnetic levitation trains (MagLev) in Japan

Repulsive force from the induced current on a conducting guideway levitates the train.

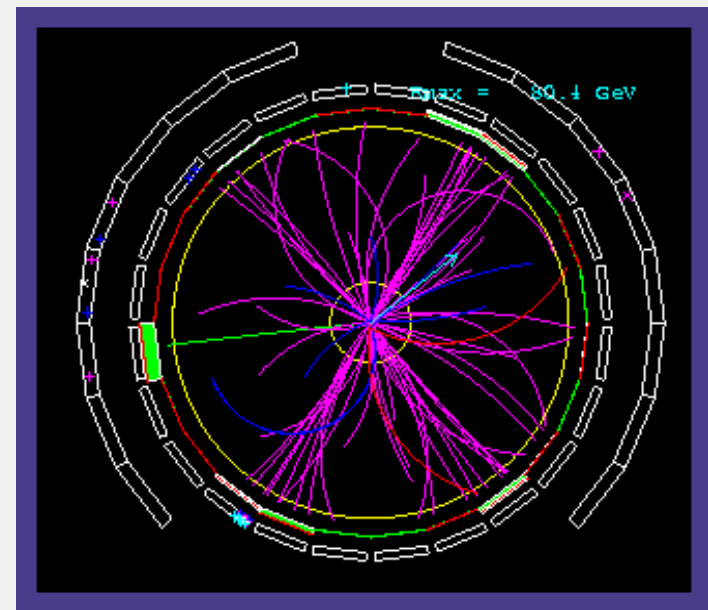

# Applications of Superconductors - 4

## High Currents in Tight Places

### Transmission Line

### Superconducting magnet

# Applications of Superconductors - 5

## Power Transmission

- First HTS cable installation in a utility network is scheduled for the year 2000.
- The first HTS coaxial HTS cable demonstration is scheduled for that same year.
- The first commercial sales of HTS cable wires are expected shortly after 2001.
- The warm dielectric cable configuration features a conductor made from HTS wires wound around a flexible hollow core. Liquid nitrogen flows through the core, cooling the HTS wire to the zero resistance state. The conductor is surrounded by conventional dielectric insulation. The efficiency of this design reduces losses.

## Manufacturing of Nb-Ti Wires

# Applications of Superconductors - 11

## Scanning SQUID microscope

A floppy disk as seen by a scanning SQUID microscope

Yttrium barium copper oxide

## Other possible applications - 1

- **Superconductor transformer**
- **Superconductor transistor**
- **Filters in Cell Phone Towers – Superconducting Filter**
- **SQUIDs (Superconducting Quantum Interference Devices): The most sensitive detectors of magnetic fields**
- **Superconductors are used in cell phone receivers, magnets, and now in transmission cables.**

## Other possible applications - 2

- The quantum properties of superconductors are used to define a voltage standard, measure small magnetic fields, and in Quantum Metrology.
- Currently the Large Hadron Collider (LHC) is one of the most powerful colliders in the world. It consists of a 27 km tunnel and employs large superconducting magnets. The collider uses over 5,000 superconducting magnets. The magnets in the LHC must be capable of producing fields of 8 Tesla, 100 000 times the strength of the Earth's magnetic field! The LHC is capable of accelerating large ions, such as lead, to energies in excess of 1250 TeV.

# Superconductors in Medicine - 1

## 1. Magnetic rezonance tomography

## 2. Biomagnetic measurements

- SQUID magnetometer
- Magnetoencephalanography (MEG systems)
- Magnetocardiography (MCG device)
- Magnetoneurography
- Gastroenterology
- Magnetopneumography
- Liver iron suspectometry

# **Superconductors in Medicine - 2**

## **Nuclear Magnetic Resonance Imaging**

**Superconducting magnets are used to generate stable (both in space and time) magnetic field**

### **MRI device**

- *MRI scan of a human skull*
- **MRI of lower human spine (image used with permission)**

# Superconductors in Medicine - 4

## Superconducting Quantum Interference Device (SQUID)

*A SQUID (Superconducting QUantum Interference Device) is the most sensitive type of detector known to science. Consisting of a superconducting loop with two Josephson junctions, SQUIDs are used to measure magnetic fields.*

# Superconductors in Medicine - 5

## MEG systems

MEG systems consist of an array of low temperature SQUID sensors (37 to 255) in a dewar that surrounds the whole head

## **Superconductors in Medicine - 6**

**The medical MRI unit to the right projects a 0.1 Tesla homogeneous field 20cm above the top plate of the cryostat.**

# Conclusions

- **Superconductivity is one of the most important phenomenon that must be studied from students of engineering specialities.**
- **The path from research experiments to commercial applications was made.**
- **It is difficult to predict the future applications but undoubtedly they will be extraordinary.**
